Arizona is one of at least 35 states that provided less school funding per student in the 2014 school year (the most recent available) than in 2008, before the recession took hold. Large cuts in K-12 funding weaken education systems, diminishing their capacity to develop fully the intelligence and creativity of the nation’s future workers and entrepreneurs.

**State funding per student down by more than one-third**

Arizona’s state funding per student fell by **36.6 percent** between 2008 and 2014. No other state imposed larger cuts.

Local governments in Arizona also cut school funding over this period, worsening the impact of the state cut. **Total state and local school funding combined fell by 22.1 percent** per student between 2008 and 2014.

Arizona’s “general” or “formula” funding per student — the primary form of state funding for schools — fell by 0.8 percent in the current school year (2017) and remains **12.8 percent below the 2008 level** due to earlier cuts.

**State K-12 cuts have serious consequences**

Arizona schools receive **38 percent of their funding from the state.** Cuts at the state level force school districts to scale back educational services and/or raise more local tax revenue to cover the gap. They also impede reforms to boost student achievement, such as improving teacher quality, reducing class sizes, and increasing student learning time.
